

Suture material and special products for

# MINIMALLY INVASIVE SURGERY

Surgical sutures

**SERAG  
WIESSNER**

## Convincing down to the smallest detail

Decades of experience

Hi-tech and hand-crafted

As the oldest German manufacturer of surgical suture material, SERAG-WIESSNER uniquely combines experience with the latest medical know-how. It is now nearly 150 years since the company began manufacturing sterile catgut.

The manufacture of surgical suture material is characterised by the contrast between state-of-the art production technology and a large number of manual production processes. At SERAG-WIESSNER, we manufacture and sterilise needle-suture combinations in our cleanrooms using computer-controlled automated equipment. At the same time, many of the production steps require the precise manual skills of our highly experienced employees. To ensure consistently high quality, we

maintain a certified quality management system in accordance with DIN EN ISO 13485 international standards.

### SERAFIT® stiffened

SERAFIT®, with its patented thread stiffening, is a braided absorbable suture made of polyglycolic acid. In contrast to the traditionally used material, SERAFIT® is stiffened with a special coating, which gives the thread greater stability of shape, as is required for loops.

This material is also particularly suitable for intracorporeal knotting.

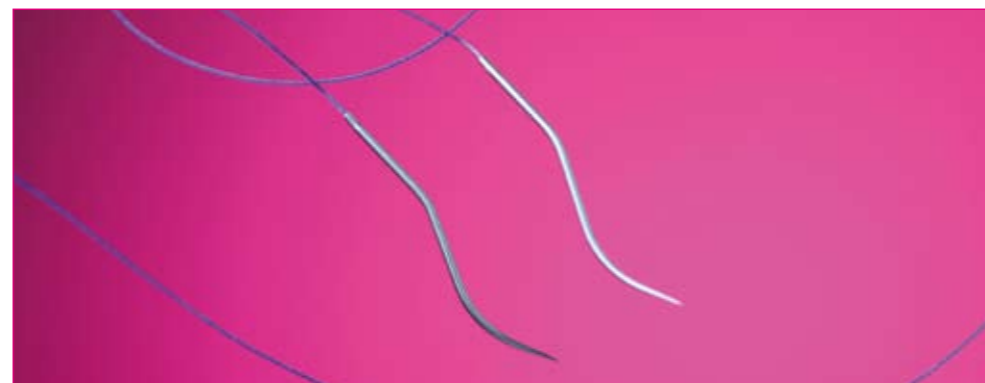

The above illustration clearly shows the advantages of using stiffened suture material for loops.

### Special products

Our wide range of special products for minimally invasive surgery includes:

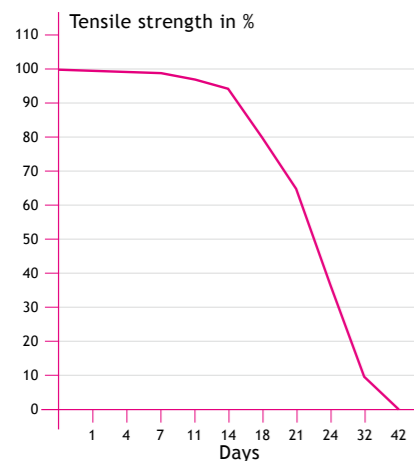

- loops with applicators, using SERAFIT®, SERALENE® and SERASYNTH®
- combinations with SERAFIT® stiffened, for intracorporeal knotting
- combinations for extracorporeal knotting
- special spoon and half-curved ski needles for trocar procedures
- special SERASYNTH® loops for the NOTES technique

### SERAFIT®

**Non-stiffened SERAFIT® (violet)** is a braided absorbable suture made of polyglycolic acid, with a special coating. Together with the distinctive braided structure, this gives the thread optimal properties, in particular: excellent flexibility, easy passage through the tissues, minimal sawing effect and good knot security. Non-stiffened SERAFIT® is used in minimally invasive surgery for extracorporeal knotting.

Stiffened SERAFIT® (violet) is the same basic material, but it holds its shape thanks to a special treatment of the thread. Stiffened material is used for loops and for intracorporeal knotting. Its half-life is about 18 days. The thread is completely absorbed within 60-90 days.

### SERASYNTH®

SERASYNTH® (violet) shows ideal absorbability for indications where a long-term wound healing is required or where a secure wound adaptation over a longer period of time is generally advisable. The material is characterised by its extremely smooth passage through the tissues, as well as its high linear and knot tensile strength.

Its half-life is approximately 28-42 days and the absorption time is 180-210 days.

### SULENE®

SULENE® (green) is a non-absorbable suture, made of braided polyester. The special coating greatly reduces the sawing effect that invariably occurs with braided sutures and reduces capillarity to a minimum.

multifilament, braided, coated

### SERALENE®

SERALENE® (blue) is a non-absorbable suture made from polyvinylidene fluoride (PVDF). PVDF is related to PTFE. In comparison with polypropylene, SERALENE® has a smooth pore-free surface, which ensures an optimally smooth passage through the tissues. The thread is characterised by a high tensile strength and the tissues heal well around the sutures. SERALENE® therefore has all the positive characteristics of polypropylene. In addition, PVDF offers high elasticity and optimal tying properties.

monofilament
